

ABSTRACT

A windscreen wiper device comprising an elastic, elongated carrier element, and an elongated wiper blade of a flexible material, and a connecting device for an oscillating arm, wherein the oscillating arm is pivotally connected to the connecting device about a pivot axis near one end, with the interposition of a joint part. The windscreen wiper device is provided with first and second retaining means for retaining the connecting device onto said oscillating arm. The first retaining means comprises at least one resilient tongue provided on the joint part engaging in a correspondingly shaped hole provided in the oscillating arm. The second retaining means comprises a least one first stop surface provided on the oscillating arm and at least one second stop surface provided on at least one of the joint part and connecting device.
